CLINICAL SUMMARY · PREPARED FOR THE CARE TEAM

# Recurrent Hypoglycemia After Increased Activity

**Andrew** · Type 1 · Omnipod + Loop (closed-loop) · Dexcom G7 · **Review period: Jun 24 – Aug 23, 2026**

> Generated from Nightscout CGM & pump data by a family member. Observational — for clinical review, not a diagnosis.

## Summary

Marching band began ~Aug 10, a sustained increase in daily activity. Since then **time below 54 mg/dL has risen to 2–3× the recommended <1% target**, concentrated in the evening (practice window) and in the following overnight/early-morning hours — a pattern consistent with delayed post-exercise insulin sensitivity. **Bolus insulin has already self-corrected down ~22%, but the basal schedule has not changed** and still reflects a sedentary summer at home. He moved into a college dorm Aug 21 and is now managing lows unsupervised (alarms are heard, fast carbs and a roommate are in place; all recorded episodes were self-treated and resolved).

## 1 · TIME BELOW RANGE, BY WEEK

| WEEK | MEAN | TIR 70–180 | % <70 | % <54 (goal <1%) |
|---|---|---|---|---|
| July (reference, pre-band) | 110 | 93% | 5.1% | 0.8% |
| Aug 3 – 9 | 113 | 89% | 7.5% | 0.8% |
| Aug 10 – 16 BAND STARTS | 115 | 88% | 8.6% | 3.1% |
| Aug 17 – 23 DORM AUG 21 | 110 | 90% | 7.4% | 1.8% |

Worst individual days: Aug 12 — 14.2% of the day <54; Aug 22 — nadir 40 mg/dL; Aug 23 — nadir 50 mg/dL. Overall glucose and A1c-equivalent remain good (mean ~110, GMI ~5.9%); the problem is hypoglycemia exposure, not average control.

## 2 · WHERE THE LOWS MOVED (BEFORE VS AFTER AUG 10)

| WINDOW | %<70 | %<54 |
|---|---|---|
| **Evening 17–21** practice | 5.9 → 14.3 | 1.1 → 4.0 |
| Overnight 00–06 | 8.7 → 7.8 | 1.1 → 2.9 |
| Morning 06–12 | 3.2 → 6.3 | 0.5 → 2.7 |
| Afternoon 12–17 | 7.9 → 6.9 | 0.9 → 1.7 |
| Late 21–24 | 7.9 → 6.0 | 1.0 → 0.4 |

Evening is the epicentre; the overnight and next-morning severe lows roughly tripled, consistent with the 12–24h tail of post-exercise sensitivity rather than anything occurring at that hour.

## 3 · BY DAY OF WEEK (SINCE AUG 10)

| DAY | MEAN | %<70 | %<54 |
|---|---|---|---|
| **Wednesday** | 103 | 18.1 | 8.2 |
| Friday | 115 | 9.4 | 3.7 |
| Sunday | 115 | 3.7 | 2.0 |
| Saturday | 108 | 5.2 | 1.9 |
| Monday | 108 | 9.2 | 0.3 |
| Tuesday | 122 | 5.6 | 0.7 |
| Thursday | 116 | 4.2 | 0.5 |

Wednesday is a clear outlier — 8.2% of the day below 54. Worth confirming against the rehearsal schedule.

## 4 · INSULIN: BOLUS HAS FALLEN, BASAL HAS NOT

| | BOLUS INSULIN | CARBS | SCHEDULED BASAL |
|---|---|---|---|
| Before Aug 10 | 43.3 U/day | 178 g/day | 38.1 U/day |
| After Aug 10 | 33.9 U/day (−22%) | 150 g/day | 38.1 U/day (unchanged) |

Loop and the user have already compensated on the bolus side. The scheduled basal was last tuned Jun 20 for a low-activity summer at home and has not been revisited since activity increased — so the residual excess is concentrated in basal, which is precisely the insulin acting during and after practice.

## 5 · REPRESENTATIVE NIGHT — SAT AUG 22 (DORM)

```
00:30   88   → "Eating Soon" override + 2.5 U
01:00  127   → "Rage" override (1.2× insulin, target 80) + 2.85 U + 10 g
01:30   76
02:00   50
02:30   43   → treated, 15 g + "Running Low" override
03:00   76  recovered
```

Post-midnight correction stacking on top of an already-heightened sensitivity state, followed by a crash ~90 minutes later. The overnight "🤬 Rage" preset (1.2× insulin, 80 target) was used 1–8 times per day across this period.

## 6 · CURRENT SETTINGS & QUESTIONS

**Basal** (38.05 U/day): 00:00 1.45 · 02:00 1.30 · 04:30 1.35 · 09:30 1.80 · 11:00 1.25 · 16:00 1.80 · 17:00 1.70 · 20:00 2.40 · 22:30 2.20
**ISF** 53 mg/dL/U · **Carb ratio** 6 g/U · **Target** 100 mg/dL · **DIA** 6 h · flat all day

- **Overall basal reduction?** Bolus has already dropped 22% while basal is unchanged from a pre-activity baseline.
- **An exercise override protocol around practice** — extending several hours past the session to cover the delayed overnight tail? Existing presets are 0.8× / target 120 and 0.7× / target 120.
- **Wednesday specifically** — 8.2% below 54 suggests that day needs its own plan.
- **Guidance on late-evening corrections**, given the post-midnight stacking pattern above.
- **ISF / carb ratio** — both flat all day and unchanged; should they move with the new activity level?

Data source: personal Nightscout instance (CGM, pump, and Loop treatment records). CGM values are 5-minute means with duplicate device readings de-duplicated. Sensor-warmup periods and rebounding overnight dips consistent with sensor compression were excluded where noted in the underlying analysis. Prepared 2026-08-23. **Not medical advice.**
